CS 290 – Fall 2019

Project Proposal - Updated

Originally, I wanted to create a website based on one of my favorite PC games, League of Legends. The website was supposed to retrieve user data about recently played matches and display item builds and champion tips for the user to improve their gameplay. I realized this would have taken a lot more time than I originally had to do this project, as I had two other classes to worry about during the time. Therefore, I decided to revise my original proposal and made a website for people to apply to “Riot Jobs,” a mock company which UX Designers, Developers, Security Engineers, and Concept Artists could apply to.

In order to meet project requirements, I downloaded and used nice concept art skins for several characters to be displayed via the carousel on the home page. I had also used an unordered list in order to display the jobs available in that subpage. In another subpage, I had a sample champion skin for users to download. And on the about page, I created a GET form in order for users to submit their email to learn more information about jobs at the company. Obviously, this is loosely based on the real company of the game, and I just wanted to create an attractive website for people to apply to for jobs. I also included a link at the footer of my pages to the website where I had retrieved the high quality images of the art concepts from the game.

I hope to be able to create other attractive websites in the future for video gamers who seek employment at video game companies like this.
